ICAFe Companies emphasize safety in the products, systems, and services that we provide. By prioritizing safety via continuous training, NFPA-compliant fluid handling and application systems, and innovative Personal Protection Equipment, we can help ensure that your finishing systems run as efficiently as possible.

Our team takes the necessary time to properly analyze the individual requirements of each of our customers. ICAFe Companies works with national and regional coatings manufacturers to ensure that we are providing the most qualified equipment to properly apply their unique coatings.

The best way to maximize efficiency and minimize downtime is by eliminating potential issues before they become real problems. ICAFe Companies will work with you to tailor a preventative maintenance program for your finishing operations to keep your throughput high, quality consistent, and sanity in-check.

Maximizing production efficiency is the perpetual goal of manufacturing companies—and wood finishing is no exception. ICAFe Companies has close relationships with the world’s biggest vendors in the industrial finishing market. This allows us to stay on the leading-edge of coatings application technology.

We’re committed to working with our customers to discover improvements in every facet of their finishing operations. Whether it’s new spray technologies, energy efficient equipment, environmentally friendly solvents, quick-curing ovens, or painter training, we work with you to ensure your process stays current and profitable.
ICAFe Companies offer manual spray guns from the biggest names in the wood finishing industry. Selecting the correct spray gun is essential in obtaining the highest levels of quality and transfer efficiency for your coating process. Atomization technologies include air spray (HVLP, Compliant, Conventional), Air-Assisted Airless, and Airless.

**Manual Spray Application**

The Right Spraygun for the Job

Automatic spraying provides repeatability and efficiency in coatings applications. From static-mounted guns to fully integrated flatline or hangline processes, ICAFe Companies will work with you to provide an efficient and economical coating system that produces consistent decorative and protective finishes.

**Automatic and Flat Line Applications**

Automatic spraying provides repeatability and efficiency in coatings applications. From static-mounted guns to fully integrated flatline or hangline processes, ICAFe Companies will work with you to provide an efficient and economical coating system that produces consistent decorative and protective finishes.

**Bonding**

Ambient, warm, and hot melt supply systems deliver high viscosity materials used in the bonding and assembly of wood products.
The fluid handling system is at the heart of every industrial wood finishing process. A well-designed and properly maintained fluid handling system will provide consistent material delivery while minimizing energy consumption.

**Pneumatic Pumps**
ICAFe Companies offers a variety of pneumatic pumps for supply and circulation systems. Selecting the appropriate pump for a given process is important for obtaining consistent material flowrate and pressure while minimizing energy costs and material shearing.

**Electric Pumps**
Electric pumps can offer significant energy savings over their pneumatic counterparts while simultaneously offering an improved level of control. Many electric pumps come with advanced reporting and diagnostic capabilities for monitoring the health of a fluid delivery system.

**Material Storage**
Paint Mix Rooms and Paint Kitchens are used to safely store flammable or hazardous materials and deliver them to the spray area through fluid circulation lines. ICAFe Companies offers Paint Mix Rooms and Paint Kitchens from Global Finishing Solutions.

**2K Proportioners**
In catalyzed 2-component finishing, proportioners can drastically reduce wasted material. ICAFe Companies offer various 2K proportioners that operate with different dosing technologies—allowing the appropriate proportioner to be selected for a specific mixing process. Most proportioners can be ordered in stainless steel acid catalyst-compatible versions.

**Piping**
A properly designed, configured, and installed piping system ensures that energy consumption is minimized, solids remain in suspension, and maintenance is easily performed. ICAFe Companies offers piping design and installation services with our wood finishing systems.

**Accessories**
ICAFe Companies offers a huge selection of finishing accessories to customize a system to suit every customer’s unique requirements. Accessories include agitators, regulators, pressure vessels, filters, ball valves, air drying systems, gauges, hoses, surge suppressors, and much more.
ICAFe Companies partner with Global Finishing Solutions to offer both catalog and custom sanding booths, spray booths, and spray enclosures. GFS’ paint booths are designed for all types of wood finishing coatings — including stains, varnishes, sealers, fillers, nitrocellulose, water-based lacquer and catalyzed lacquer.

ICAFe Companies work with several oven manufacturers to offer a variety of heat processing technologies to cure coatings. There are several factors that affect oven choice such as part geometry and size, expected throughput, material substrate, and coating properties.

Choosing the proper method of product conveyance is critical to maximizing throughput, transfer efficiency, and flexibility.
Take Control of Your Coatings

A properly configured finishing system can produce significant savings and drastically reduce headaches. Control the quality and cost of your wood finishing system by customizing the process to suit your needs.

Our technical sales and engineering teams bring the experience and knowledge to deliver world-class integrated systems.
